18. Suggested Implementation Roadmap..... 34

19. Summary & Recommendation 35

1. Executive Summary

This document defines the scope of an advanced Offers & Discounts module to be embedded inside the Future Link Consultants CRM. The module transforms a simple discount list into a full promotions engine that creates, targets, distributes, tracks, and optimises offers across all of the company's service lines and across every customer touchpoint.

Future Link operates multiple branches with multiple counsellors per branch, serving leads and existing clients across four core service lines: study abroad, coaching for foreign exams (IELTS, TOEFL, PTE, GRE, GMAT, SAT, etc.), foreign language training (German, French, Spanish and others), and visa & immigration services. The promotions engine is designed around this structure so that offers can be created centrally, controlled by role, targeted by segment, and delivered through WhatsApp, SMS, email, calls and social media from a single screen.

The core objective

Increase enrolment conversion and repeat business by giving the right offer to the right person at the right moment, through the right channel — while keeping every discount auditable, approval-controlled, and measurable against revenue.

1.1 What This Module Delivers

- **A central offer library** where every promotion is created once and reused everywhere.
- **Smart targeting** that connects offers to CRM segments — leads, existing clients, family members, Gen-Z students, lapsed enquiries, and more.
- **Automation (auto-offers)** that trigger themselves based on customer behaviour, dates, and lifecycle stage with no manual effort.
- **Omni-channel distribution** through WhatsApp, SMS, email, social media and counsellor-assisted calls.
- **Approval workflows and guardrails** so discounts never erode margin without control.
- **Analytics** that tie every offer to redemptions, revenue, and branch / counsellor performance.

2. Current Implementation Status

A large part of this module already exists in the CRM today. This section records — verified against the actual codebase, not inferred from screen names — what is built, what is partially built, and what is not yet started, plus how the existing pieces connect internally. The goal is to extend the live system rather than rebuild it.

Verification basis

The status below was checked by reading the live database schema and the page logic (Give Discount, Wallet Top-ups, Period Close, Incentive Plans, Offers Admin, Offer Analytics, Portal Offers/Refer) and the wallet/offer functions. Where the migration files were

created via the Lovable dashboard rather than committed SQL, behaviour was confirmed from the frontend code that calls them.

2.1 Already Built (Reuse)

These are present and working today and must be reused:

Area	What Exists Today (verified)
Offer engine	`offers`, `offer_templates`, `offer_groups`, `offer_group_members`, `offer_audience_targets`, `offer_events`, `offer_tracking_codes`, `client_offers`, `service_offers`
Offers admin UI	Offers Admin (create/edit/delete offers, percentage/flat, audience, active flag) and Offer Analytics screens
Counsellor wallet	`discount_wallets` (balance, currency, budget kind, per-client % and amount caps, validity, rollover, scope tags)
Discount giving	Give Discount screen inserts into `wallet_allocations`; a DB trigger enforces the % cap and balance; over-cap is flagged
Wallet ledger	`wallet_ledger` (entry type, amount, `balance_after`, references) already records movements
Wallet top-ups	`wallet_topups`, `wallet_allocations`, plus a `wallet_topup_rules` table keyed by achievement % / role / branch
Incentive engine	`incentive_plans`, `incentive_schemes`, `incentive_slabs` (thresholds + rate types), `incentive_targets`, `incentive_runs`, `incentive_payouts` (with TDS), `incentive_line_items`, `incentive_adjustments`
Period close	Period Close screen + `fn_close_due_wallets` and `fn_reinstate_wallet`; grace window in `wallet_settings`; computes achievement % = run total ÷ target
Offer analytics fns	`offer_roi_stats`, `counselor_offer_stats`, `offers_eligible_for_client`, `user_can_see_offer`, `log_offer_event`
Family & referrals	`client_family_members`, `referrals` (points + joined client), Portal Refer screen
University promos (partial)	`upi_promotions` (auto-detected institution promotions), `upi_marketing_campaigns`, `vw_campaign_performance`
Client loyalty wallet	`credit_wallet` — a SEPARATE points wallet (not the counsellor wallet)
Portal offers	Client-facing Portal Offers screen

2.2 Partially Built — Needs Connecting / Extending

The building blocks exist but are not yet wired together to deliver the design in this document:

Capability	What's Already There	What's Missing
Achievement-linked wallet sizing	Achievement % is computed at Period Close; `wallet_topup_rules` has `min_achievement_pct` / `max_achievement_pct`	These rules are not yet applied to auto-size or auto-top-up the wallet; top-ups are still entered manually
Proportional unlock	Wallet balance, caps and allocations all exist	Unlock-by-achievement gating (spendable ≤ unlocked) is not enforced; full balance is spendable now
Base × multiplier allocation	Incentive slabs and `bonus_trigger_pct` exist for payouts	The same band logic is not yet used to size the discount wallet
Strategic wallets	`discount_wallets` already has `scope_country_tag`, `scope_service_code`, `scope_master_key` and a `scoped` budget kind; Wallet Top-ups UI sets them	Ring-fenced spend enforcement at allocation time + a management funding view
Performance Score	Targets, runs, conversion source data exist	The weighted score (revenue/conversion/ROI/collections/satisfaction) that drives the multiplier
Offer lifecycle	`is_active` flag on offers	Status workflow, version & approval history, lifecycle dashboard widgets
Analytics	ROI & counsellor stats functions	Wallet Impact Revenue, Offer Influence Revenue, leaderboards

2.3 Not Yet Built (New)

- Funding-source field on offers (Future Link / University / Joint) and funding-aware wallet deduction — though `upi\_promotions` is a useful starting point for university data.
- Promotion Request workflow (field requests routed to marketing).
- Corporate Promotions Calendar (central annual planning across all campaign types).
- Restricted offer-builder enforcement (approved self-serve types vs. approval-required).
- AI offer suggestions, drafting, and phased auto-send.
- Offer Influence Revenue attribution (direct / assisted / multi-service).

2.4 How It Connects Internally

The pieces above are not separate islands — the design works because data already flows between them. The diagram below describes the intended internal wiring; most of the boxes exist, and the work is largely in the arrows that are not yet connected (shown as “TO WIRE”).

In words, the intended flow is:

1. **Target set** — a counsellor's target lives in ``incentive_targets``; revenue achieved is aggregated in ``incentive_runs``. Period Close already computes achievement % from these two.
2. **Wallet sized & unlocked (TO WIRE)** — ``wallet_topup_rules`` (which already holds ``min_achievement_pct``/``max_achievement_pct`` per role/branch) should be read to size the ``discount_wallets`` balance and to gate how much is unlocked, instead of today's manual top-up. This is the single most important connection to build.
3. **Discount given** — Give Discount inserts a ``wallet_allocations`` row; the DB trigger enforces the per-client % cap and the balance, and writes a ``wallet_ledger`` entry with ``balance_after``. This already works.
4. **Offer linked** — ``wallet_allocations`` already references ``offer_id``, ``client_id``, ``lead_id`` and ``invoice_id``, so a discount is tied to the specific offer and deal — the hook needed for Wallet Impact and Influence reporting.
5. **Period close** — ``fn_close_due_wallets`` closes the wallet with the chosen rollover policy and seeds the next period; achievement % computed here should feed the next wallet's size (TO WIRE).
6. **Strategic ring-fencing** — because ``discount_wallets`` already carries scope tags, a scoped wallet only needs the allocation trigger to check the offer/client against the tag before allowing spend (TO WIRE).

The headline for developers

The wallet, ledger, allocations, caps, incentive targets/runs and achievement calculation already exist and work. The performance-linked behaviour in this document is mostly a wiring job: connect ``wallet_topup_rules`` and the Period Close achievement % to the

sizing/unlocking of `discount\_wallets`, enforce scope tags at allocation, and add lifecycle + funding + analytics on top. That is far less work than building from scratch.

Naming note for developers

Two different wallets exist and must not be confused: `credit\_wallet` is the CLIENT loyalty-points balance; `discount\_wallets` is the COUNSELLOR discount-budget wallet this document's Counsellor Offer Wallet section refers to. New work extends `discount\_wallets`, never `credit\_wallet`. Likewise, `incentive\_\*` tables pay staff incentives — related to, but distinct from, the discount wallet.

3. Business Goals & Success Metrics

The module is justified by measurable commercial outcomes. The following goals and key performance indicators (KPIs) should be baked into the analytics dashboard from day one.

Business Goal	How the Module Helps	Primary KPI
Convert more leads	Time-limited and first-enrolment offers create urgency	Lead-to-enrolment conversion %
Increase repeat business	Existing-client and cross-sell offers	Repeat enrolment rate
Grow referrals	Family & friend referral offers	Referrals per enrolled client
Lift average ticket value	Bundle offers across service lines	Average revenue per client
Reduce manual effort	Auto-offers and scheduled campaigns	Offers sent automatically vs. manually
Protect margin	Approval workflow + discount caps	Average discount % vs. cap
Improve channel ROI	Per-channel attribution	Redemptions & revenue per channel

4. Module Architecture & Navigation

The module sits under the existing "Offers & Discounts" menu. The current two items (Offers & discounts, Offer analytics) expand into a structured workspace. The recommended left-navigation structure is below.

Sub-Section	Purpose
Dashboard	At-a-glance view of active offers, redemptions today, top performers, expiring soon, pending approvals.
Offer Library	Master list of every offer — create, clone, edit, archive. Filter by type, service, status, branch.
Create Offer	Step-by-step wizard for building any offer type.
Offer Lifecycle	Status workflow, version & approval history, expiry reminders.
Promotion Requests	Field requests for new offers, routed to marketing for review.
Auto-Offer Rules	Behaviour and date-based triggers that fire offers automatically.
Campaigns & Calendar	Bundle offers into campaigns; central annual promotions calendar.
Segments & Audiences	Define and reuse target groups (Gen-Z, family, lapsed leads, etc.).
Funding & Partners	Track Future Link / university / joint-funded promotions.
Coupon & Code Manager	Generate, distribute and track unique / bulk promo codes.
Approvals	Queue for offers needing manager/admin sign-off.
Channels & Templates	WhatsApp, SMS, email and social templates linked to offers.
Offer Analytics	Full performance reporting and attribution.
Settings & Permissions	Discount caps, role rights, branch rules, compliance.

Design principle: create once, use everywhere

An offer is a single object. When created it can be attached to any number of segments, campaigns, channels and auto-rules. This avoids duplicate offers, keeps reporting clean, and means a counsellor and the marketing team are always referring to the same promotion.

5. Offer Types Catalogue

This is the heart of the module — the range of offers it can run. Each type below should be a selectable template in the Create Offer wizard, pre-filled with sensible defaults so counsellors and marketers do not start from a blank screen.

5.1 Standard & Multiple Offers

The system must support many concurrent offers without conflict. Each offer carries a priority and stacking rule so the CRM knows what to apply when more than one offer is eligible for a single customer.

Offer Type	Description	Example
Percentage discount	% off a service fee	15% off IELTS coaching
Flat amount discount	Fixed currency amount off	₹5,000 off Germany study package
Free add-on	Bundled free service	Free visa filing with study package
Bundle / combo	Multiple services at a package price	IELTS + German A1 combo
Tiered discount	Bigger discount at higher spend	₹3k off above ₹50k; ₹8k off above ₹1L
Buy-one-get-one	Second service free/discounted	2nd language course at 50%
Instalment / EMI offer	0% interest or split payments	3-instalment fee plan
Scholarship-style waiver	Merit / need based fee waiver	Top scorer gets 25% waiver

5.2 Auto-Offers (Behaviour-Triggered)

Auto-offers are the intelligence layer. They watch the CRM for events and lifecycle changes and fire the right offer automatically, with no counsellor action. Each rule follows a simple structure: WHEN a trigger occurs, IF conditions match, THEN send an offer via a channel.

Trigger	Condition / Segment	Auto-Offer Sent
New lead created	No enrolment yet	Welcome / first-consultation offer
Lead inactive 7 days	Opened but not enrolled	Limited-time win-back discount
Lead inactive 30 days	Cold lead	Final-call deep discount
Demo / counselling attended	Not yet paid	48-hour enrolment incentive
Course nearing completion	Existing client	Next-step / cross-sell offer
Exam date approaching	Coaching client	Crash-course or retake offer
Birthday	Any contact	Personalised birthday discount
Enrolment anniversary	Existing client	Loyalty reward
Payment due reminder	Partial payer	Early-payment incentive
Abandoned application	Started visa/admission form	Assistance + discount nudge

Trigger	Condition / Segment	Auto-Offer Sent
---------	---------------------	-----------------

Why auto-offers matter most

Counsellors are busy and leads go cold quietly. Auto-offers guarantee that no lead is left without a timely, relevant nudge — which is typically where the largest conversion gains come from. Build this engine as a first-class feature, not an afterthought.

5.3 Festival & Seasonal Offers

A built-in festival calendar lets marketing schedule campaigns in advance. Offers auto-activate on the start date and expire on the end date. The calendar should be editable so regional and international festivals can be added.

Occasion	Tie-in	Suggested Hook
Diwali / New Year	All services	Festive fee-waiver season
Republic / Independence Day	Visa & study	Patriotic flat-off campaign
Intake seasons (Fall/Spring/Summer)	Study abroad	Early-bird intake discount
Exam result seasons	Coaching	Score-celebration / retake offer
Back-to-school / academic year	Language	New-batch joining offer
Year-end	All	Plan-ahead booking discount
International Mother Language Day	Language training	Language-course themed offer

5.4 Existing-Client Offers

- **Loyalty discounts** — automatically unlocked once a client completes their first service with Future Link.
- **Cross-sell offers** — e.g., a student who finished IELTS coaching is offered a discount on the study-abroad or visa package.
- **Up-sell / upgrade offers** — move a client from a basic to premium package at a reduced upgrade price.
- **Renewal / re-engagement** — for clients whose process stalled or who returned after a gap.
- **Milestone rewards** — visa approved, admission secured, exam passed — celebrate with the next-stage offer.

5.5 Family Members Offer

Because immigration and study decisions are family decisions, the module should explicitly recognise family relationships in the CRM and reward them.

- **Family enrolment discount** — when two or more family members enrol (e.g., siblings for coaching, or spouse + applicant for immigration).
- **Family referral** — an existing client refers a parent, sibling or spouse and both receive a benefit.
- **Dependent visa bundle** — discounted dependent / spouse visa filing when added to a primary applicant.
- **Household package** — language training for the whole family at a combined rate.

5.6 Gen-Z & Student Offers

A large share of Future Link's audience is young, mobile-first, and price-aware. These offers should feel native to that audience and run primarily through social and WhatsApp.

- **Student-ID / college-verified discount** — instant offer on uploading a valid student ID.
- **Group / squad offer** — friends who enrol together each get a discount (great for exam-coaching batches).
- **Refer-your-batchmates** — gamified referral with social sharing.
- **Flash / drop offers** — short, social-media-only deals creating urgency ("24-hour drop").
- **Spin-the-wheel / scratch card** — interactive reward on landing pages and WhatsApp.
- **First-year-abroad starter kit** — value add-ons (forex, SIM, accommodation guidance) bundled at a discount.
- **Content-creator / ambassador offer** — student ambassadors earn rewards for sign-ups.

5.7 Additional High-Value Offer Types

Offer	Best For	Notes
Early-bird	Intake & exam batches	Reward early commitment
Last-minute / urgency	Filling open seats	Countdown timer driven
Referral (general)	All clients	Two-sided reward
Win-back	Lapsed leads/clients	Auto-triggered
Corporate / institutional	Tie-up colleges & companies	Bulk negotiated rate
Geo / branch-specific	Local promotions	Per-branch control
First-come limited slots	Scarcity offers	Capped redemption count
Pay-in-full discount	Cash-flow	Reward upfront payment

6. Offer Lifecycle Management

Every offer must follow a controlled lifecycle from creation to retirement. With hundreds of offers running across multiple branches and service lines, governance is essential to prevent clutter, stop stale offers being used, and keep a clear audit trail of who changed what and when.

6.1 Offer Statuses

Each offer moves through a defined set of statuses. Transitions are controlled — for example, an offer cannot go Active without first being Approved.

Status	Meaning
Draft	Being created; not yet submitted
Pending Review	Submitted, awaiting marketing/admin review
Approved	Cleared for use, not yet live
Scheduled	Approved with a future start date
Active	Live and available to apply/send
Expiring Soon	Within the configured window before expiry
Expired	Past end date; can no longer be applied
Archived	Retired and removed from active lists, retained for records

6.2 Lifecycle Features

- **Automatic status updates** — offers move to Active, Expiring Soon and Expired automatically based on their dates.
- **Offer approval history** — a record of who reviewed, approved or rejected each offer and when.
- **Offer version history** — every saved version is retained so changes can be compared and rolled back.
- **Change log tracking** — a full audit of edits to terms, discount, dates, audience and channels.
- **Clone existing offer** — duplicate a live offer as a starting point for a new one.
- **Clone archived offer** — reuse a past offer without un-archiving the original.
- **Restore archived offer** — bring an archived offer back into the active workflow when needed.
- **Expiry reminders** — notifications to the offer owner ahead of expiry so action can be taken.

6.3 Dashboard Widgets

The Offers dashboard surfaces lifecycle state at a glance through dedicated widgets:

Widget	Shows
Active Offers	All currently live offers
Expiring Offers	Offers approaching their end date
Draft Offers	Work in progress not yet submitted
Archived Offers	Retired offers retained for records and cloning

Purpose

Prevent clutter and maintain long-term offer governance when hundreds of offers exist across multiple branches. Controlled statuses, full history and clear dashboards keep the offer library clean, auditable and trustworthy as it scales.

7. Promotion Request Workflow

Counsellors and Branch Managers cannot create offers freely, but they often have the best read on what the market needs. The Promotion Request Workflow lets the field formally request new offers and campaigns, which the central marketing team reviews and builds. This gives the field influence over campaigns without granting unrestricted offer-creation rights.

7.1 Workflow

Request Offer → Marketing Review → Approval → Offer Creation → Campaign Launch

Each request is tracked through these stages with status visible to the requester, so the field can see where their idea stands.

7.2 Request Form Fields

To make requests actionable and comparable, each submission captures:

Field	Why It Is Captured
Reason for request	The business rationale
Target audience	Who the offer is for
Country	Destination market the offer supports
Service	Service line (study, coaching, language, visa)
Estimated lead volume	Scale of the opportunity
Competitor information	What rivals are offering
Expected business impact	Anticipated revenue / conversion uplift

Purpose

Field	Why It Is Captured
	Allow field teams to influence campaigns without giving unrestricted offer-creation rights. The centre keeps control of margin and brand, while the people closest to the market shape what gets built. This is the formal counterpart to the "central creates, the field chooses/requests" principle.

8. Targeting, Segments & Audiences

Targeting is what makes an offer effective. The module pulls live data from the CRM to build dynamic segments — groups that update themselves as contacts change. An offer is attached to one or more segments and only those contacts become eligible.

8.1 Segment Building Blocks

Segments are built by combining filters across these data dimensions:

- **Lifecycle stage** — new lead, engaged lead, demo attended, enrolled, completed, lapsed.
- **Service interest** — study abroad, exam coaching, language, visa/immigration (and specific courses).
- **Demographics** — age band (e.g., Gen-Z), location, language, family group.
- **Behaviour** — pages visited, messages opened, calls attended, forms abandoned.
- **Commercial** — spend to date, packages held, payment status.
- **Geography / branch** — assigned branch and counsellor.

8.2 Pre-Built Audience Library

Audience	Definition (auto-maintained)
Hot leads	Engaged in last 7 days, not yet enrolled
Cold leads	No activity 30+ days, not enrolled
Gen-Z students	Age 16–24, student status
Existing clients	At least one completed/active enrolment
Family groups	Contacts linked by family relationship
Cross-sell ready	Completed one service, no second service
High-value clients	Spend above a configurable threshold
At-risk / lapsing	Stalled mid-process
Exam-soon	Exam date within 30 days
Intake-deadline-soon	Application deadline approaching

9. Omni-Channel Distribution

Every offer can be pushed through one or many channels from inside the module. Channel templates are linked to the offer so the discount code, expiry and terms stay consistent everywhere. Personalisation tokens (name, course, counsellor, expiry, code) auto-fill per recipient.

Channel	Best Used For	Module Capability
WhatsApp	Fast, high-open personal outreach	Templated broadcasts, click-to-claim, chatbot delivery
SMS	Reminders, urgency, codes	Bulk send with personalised codes & short links
Email	Detailed offers, newsletters	Designed templates, drip sequences, A/B testing
Counsellor calls	High-touch, high-value leads	Offer scripts + one-tap send during call
Social media	Reach & Gen-Z acquisition	Auto-post / scheduled posts, trackable links per platform
In-CRM / portal	Logged-in clients	Banner offers in client dashboard
Landing pages	Campaign capture	Auto-generated offer pages with lead form

9.1 Social Media Integration

Social is treated as a first-class channel for acquisition and Gen-Z reach. The module should connect to the company's accounts and support:

- Scheduled and auto-published posts and stories tied to a live offer.
- Unique trackable links / UTM codes per platform (Instagram, Facebook, LinkedIn, YouTube, X).
- Click-to-WhatsApp and click-to-form from social posts, capturing leads straight into the CRM.
- Influencer / ambassador links so social-driven sign-ups are attributed and rewarded.

9.2 Email Marketing

- Drag-and-drop template builder with reusable branded blocks.
- Drip / sequence automation (e.g., offer → reminder → last-chance).
- A/B testing of subject lines and offers.
- Open, click and redemption tracking fed back into analytics.

10. University Funded Promotions

Not every discount costs Future Link money. Many promotions are funded wholly or partly by partner universities — application fee waivers, scholarships and the like. The system must distinguish funding sources so that wallet deductions, profitability and ROI are calculated correctly. A university-funded waiver must not draw down a counsellor's wallet, because it costs the company nothing.

Funding Models

Funding Model	Who Pays	Wallet Impact
Future Link Funded	Future Link bears the discount	Deducts from counsellor / company wallet
University Funded	Partner university bears the cost	No wallet deduction
Joint Funded	Shared between both parties	Only Future Link's share deducts from wallet

Typical University-Linked Offers

- Application fee waivers.
- Scholarships.
- Accommodation grants.
- Early application incentives.
- Partner university promotions.

What Must Be Tracked

Field	Why It Matters
Funding source	Future Link / University / Joint
University contribution	Amount funded by the university
Future Link contribution	Amount funded by Future Link (the only part hitting the wallet)
Revenue generated	Business produced by the promotion
ROI generated	Return relative to Future Link's own contribution
University-wise reporting	Performance and profitability per partner university

Purpose & why it matters

This enables accurate future reporting and profitability analysis. Critically, it also keeps the wallet maths correct: only Future Link's own contribution is deducted from a counsellor's wallet, so university-funded generosity is never mistakenly charged against a counsellor's earned discount budget. University-wise reporting also shows which partners deliver the best return.

11. Corporate Promotions Calendar

A central annual planning calendar gives the whole organisation one view of every promotional activity — so campaigns are coordinated, budgets are visible, and nothing clashes or is forgotten. It is the single source of truth for all of Future Link's promotional activity across branches and service lines.

What the Calendar Displays

Activity Type	Examples
Festival Campaigns	Diwali, New Year, regional festivals
Intake Campaigns	Fall / Spring / Summer intake pushes
Country Campaigns	Destination-specific drives (e.g., Germany growth)
Branch Campaigns	Local, branch-led promotions
University Promotions	Partner-funded offers and deadlines
Open Houses	On-site information events
Education Fairs	External fairs and exhibitions
Webinars	Online sessions and info events
Social Media Campaigns	Platform-specific scheduled campaigns

Views & Features

- **Views** — Monthly, Quarterly and Annual perspectives on all activity.
- **Campaign owner** — the person accountable for each activity.
- **Budget allocation** — planned spend per campaign, visible centrally.
- **Reminder notifications** — alerts ahead of launch and key milestones.
- **Status tracking** — planned, in progress, live, completed.

Purpose

A single source of truth for all Future Link promotional activities. With every festival, intake, country, branch, university and digital campaign on one calendar — with owners, budgets and status — management can plan the year coherently and avoid overlap, gaps or last-minute scrambles.

12. Coupon & Code Management

Codes are how offers are claimed and tracked. The Coupon & Code Manager generates and governs them.

- **Unique codes** — one-per-person codes for personalised and referral offers (prevents sharing/abuse).

- **Bulk / generic codes** — shared codes for broad campaigns (e.g., DIWALI15).
- **QR codes** — for print, events and walk-in branches.
- **Usage limits** — per code, per customer, and total redemption caps.
- **Validity windows** — start/end dates and time-of-day controls.
- **Auto-expiry & auto-disable** — once cap or date is hit.
- **Fraud guards** — block self-referral, duplicate accounts, and stacking beyond allowed rules.

13. Business Rules, Approvals & Guardrails

Discounts directly affect margin, so control is essential — especially with many counsellors across many branches. The module enforces rules automatically.

13.1 Discount Guardrails

- **Maximum discount caps** by service line and by role (a counsellor may offer up to X%, a branch manager up to Y%).
- **Stacking rules** — define which offers can or cannot combine, and a maximum total discount per transaction.
- **Floor price protection** — block any combination that pushes a fee below a configured minimum.
- **Expiry enforcement** — expired offers cannot be applied, even manually.

13.2 Approval Workflow

7. A counsellor or marketer creates or requests an offer/discount.
8. If it is within their allowed cap and an approved template, it applies instantly.
9. If it exceeds their cap or is a new custom offer, it routes to the branch manager / admin Approvals queue.
10. Approver sees the offer, the margin impact, and approves, edits, or rejects with a note.
11. All actions are logged for audit.

13.3 Roles & Permissions

Role	Can Do	Limits
Administrator	Create any offer, set caps, manage all branches, view all analytics	Full control
Branch Manager	Approve offers within branch, create branch offers, view branch analytics	Within branch & cap
Marketing	Build campaigns, templates, social/email sends, segments	Cannot override caps

Role	Can Do	Limits
Counsellor	Send approved offers to assigned leads/clients, apply within personal cap	Personal cap only
Viewer / Auditor	Read-only access to offers and reports	No edits

14. Offer Analytics & Attribution

Analytics close the loop: they prove which offers, channels, branches and counsellors drive revenue, and they feed optimisation. The dashboard should answer "what is working, where, and for whom?" at a glance.

14.1 Core Metrics

Metric	What It Tells You
Offers sent / delivered / opened	Reach and channel health
Claim / redemption rate	Offer attractiveness
Conversion rate	% of recipients who enrolled
Revenue influenced	Money tied to each offer
Discount cost	Total given away per offer
ROI per offer	Revenue vs. discount cost
Channel performance	Best channel per offer/segment
Branch & counsellor leaderboard	Who converts offers best
Segment response	Which audiences react to which offers
Time-to-conversion	How fast offers close deals

14.2 Offer Influence Revenue

Most analytics measure only the immediate conversion on an offer. Offer Influence Revenue captures the full long-term value an offer generates, including downstream purchases the offer set in motion. This is how the company sees the true return on a promotion rather than just its first sale.

Attribution Type	What It Counts
Direct Offer Conversion	Revenue from the service the offer was applied to
Assisted Conversion	Revenue from later purchases the offer influenced
Multi-Service Conversion	Revenue across additional service lines the lead bought into

Attribution Type	What It Counts
Worked example A lead receives a Germany offer and enrolls in the study-abroad package (direct). Over the following weeks they also buy a German language course and a visa service. The CRM attributes the influenced revenue from all three back to the original Germany offer, so its true contribution is visible — not just the first enrolment.	

This pairs directly with Wallet Impact Revenue (16.4.1): together they show both which offers drive business through the wallet and how much total downstream value each offer ultimately creates.

14.3 Optimisation Features

- **A/B testing** — run two versions of an offer or message and auto-pick the winner.
- **Best-offer suggestions** — the system recommends the next-best offer for a given lead based on past response data.
- **Best-time-to-send** — schedule sends when each segment is most responsive.
- **Margin-vs-volume view** — see whether deeper discounts actually generate enough extra volume to be worth it.

15. Automation Journeys (Worked Examples)

These illustrate how the pieces combine into hands-free revenue journeys.

15.1 Cold-Lead Win-Back

Lead enquired about study abroad, attended a counselling call, but did not enrol.

12. Day 2 after call — WhatsApp: 48-hour enrolment incentive with unique code.
13. Day 7 — Email: success stories + same offer reminder.
14. Day 15 — SMS: "offer expiring" urgency message.
15. Day 30 — Counsellor task auto-created + manager-approved deeper final offer.

15.2 Cross-Sell After Exam Coaching

Client completes IELTS coaching with a strong score.

16. On completion — Milestone congratulations message.
17. +2 days — Study-abroad package offer (the natural next step) at a loyalty rate.
18. +7 days — Family offer: refer a sibling/friend for coaching, both benefit.

15.3 Festival Family Campaign

19. Diwali campaign auto-activates from the festival calendar.

20. Targets existing clients + their linked family groups.
21. Sends across WhatsApp, email and social simultaneously.
22. Family-enrolment discount applies automatically at checkout for qualifying groups.

16. Performance-Linked Counsellor Offer Wallet

This section introduces a discount-budget system that decentralises offer-making to individual counsellors and branches within strict financial limits. Each counsellor receives a monthly Offer Wallet — a capped discount budget they can spend to create and run their own offers for their assigned audience. The size of next month's wallet is determined by this month's performance, turning discounting into a self-funded, performance-linked growth and competition engine.

The core idea

Instead of every discount being centrally dictated, each counsellor gets a monthly "discount budget" wallet. They decide how to spend it — small offers to many leads, or a larger offer to close a key deal — but they can never exceed the balance. Strong performers earn larger wallets next month; this rewards results, builds ownership, and creates healthy competition between counsellors and branches.

16.1 How the Offer Wallet Works

23. Each counsellor is allocated a monthly Offer Wallet balance (a discount budget expressed in currency, e.g., ₹40,000).
24. Every offer they create or apply draws down from this balance by the value of the discount given. A ₹5,000 discount used on a deal deducts ₹5,000 from the wallet.
25. Counsellors can build their own offers — type, size, validity, target audience — funded entirely from their wallet, within global guardrails (caps, floor price, stacking).
26. When the wallet is exhausted, no further self-funded discounts can be given that month without manager approval and a top-up.
27. Unused balance does not silently carry over by default — see carry-over policy in 16.5.
28. At month end, performance is measured and next month's wallet is recalculated automatically.

16.2 Important: Budget Wallet, Not Cash

The Offer Wallet is a discount-authority budget, not real money paid to the counsellor. It represents how much discount value a counsellor is authorised to give away in a month. This distinction matters for accounting, payroll and compliance, and should be clearly labelled in the UI to avoid confusion.

	Offer Wallet (this feature)	Cash / Incentive (separate)
What it is	Authority to give discounts	Money paid to staff

	Offer Wallet (this feature)	Cash / Incentive (separate)
Affects	Discount given to clients	Counsellor earnings
Limit	Hard monthly cap	Per incentive policy
Drawn down by	Each discount applied	Not applicable

16.3 Wallet Allocation — Base Wallet + Performance Multiplier

Rather than a flat percentage of target, the wallet is built from a base allocation multiplied by a performance factor earned in the previous period. This makes the system aspirational: counsellors are actively rewarded for exceeding target, not merely for being assigned a large one. The base wallet is set against the assigned target; the multiplier is driven by last period's Performance Score (defined in 16.4).

How the wallet size is set

Wallet = Base Wallet × Performance Multiplier.

Example: Target ₹3,00,000, Base Wallet ₹10,000. A counsellor who hit 120% of target last period earns a 150% multiplier → ₹15,000 wallet. One who reached only 60% earns a 50% multiplier → ₹5,000 wallet. The base, the bands and the multipliers are all configurable per service line and role.

Performance Multiplier Bands (Example)

Last-Period Achievement	Multiplier	Wallet on ₹10,000 Base
Below 70%	50%	₹5,000
70 – 90%	100%	₹10,000
100%	120%	₹12,000
120%	150%	₹15,000
150%+	200%	₹20,000

These bands are illustrative — management sets the actual figures. The key effect is that beating target earns disproportionately more discount firepower, so counsellors push to exceed rather than just meet their numbers.

Inputs Driving the Wallet

Input	Source	Effect on Wallet
Assigned target	Set by manager for the period	Sets the Base Wallet
Base Wallet	Configured per service / role	Starting allocation before multiplier

Input	Source	Effect on Wallet
Performance Score (last period)	Weighted score out of 100 (see 16.4)	Sets the Performance Multiplier band
Wallet Impact Revenue	Revenue generated through wallet offers	Rewards actual use of the system
Wallet Efficiency (ROI)	Revenue generated ÷ wallet used	Rewards efficient discounting
Margin discipline	Stayed above floor price	Protects against over-discounting

Guard against the wrong incentive

Wallet growth must reward efficient, real business creation — not how much discount a counsellor hands out. The Performance Score (16.4) combines achievement, conversion, ROI, collections and satisfaction precisely so that bigger discounts alone never earn a bigger wallet. A counsellor who converts efficiently is always rewarded over one who discounts heavily for the same result.

16.4 Performance Score — What Drives the Multiplier

Next period's multiplier is set by a single weighted Performance Score out of 100, not by revenue alone. This prevents fake sales, excessive discounting and poor-quality enrolments, and ensures the wallet rewards healthy, collectible, satisfied business.

Metric	What It Measures	Weight
Revenue Achievement	Revenue vs. assigned target	40%
Conversion Rate	Leads converted to enrolments	20%
Wallet ROI	Revenue generated ÷ wallet used	20%
Collections Received	Fees actually collected, not just booked	10%
Client Satisfaction	Feedback / quality of enrolments	10%

Score out of 100 → maps to the multiplier band → sets next period's wallet. All weights are configurable.

16.4.1 Wallet Impact Revenue

A critical refinement: do not size the next wallet on total revenue alone, because a counsellor can hit target without ever using the offers system. The wallet must reward revenue generated through wallet offers specifically.

Why this matters

Counsellor A: revenue ₹3,00,000 but only ₹20,000 came through wallet offers — they barely used the system.

Counsellor B: revenue ₹2,50,000 with ₹1,50,000 driven by wallet offers — they are actively creating business with the tool.

Counsellor B should be recognised as the stronger user of the system. "Wallet Impact Revenue" — revenue directly attributable to offers — is tracked separately and feeds the score and future allocation.

16.4.2 Wallet Efficiency (ROI)

Efficiency is measured as revenue generated per rupee of wallet used. This is what stops counsellors from simply giving bigger discounts to chase the same result.

Counsellor	Wallet Used	Revenue Generated	ROI	Outcome
A	₹5,000	₹50,000	10×	Standard reward
B	₹5,000	₹2,00,000	40×	Larger wallet next period

Both spent the same budget, but B generated four times the revenue. B earns the bigger wallet. Without an ROI measure, the system would quietly reward whoever discounts the most.

16.5 Proportional Unlock — Wallet Releases as Targets Are Achieved

Once the wallet size is set, it does not become fully spendable on day one. The spendable balance unlocks in step with the percentage of target achieved so far in the period. A counsellor cannot give away the full discount budget while sitting far below target — they unlock more discount power only as they bring in revenue. The unlock threshold is configurable.

Worked Example

Wallet for the period (after multiplier): ₹15,000

Revenue Achieved	% of Target	Wallet Unlocked	Spendable on Discounts
₹0	0%	0%	₹0 (locked)
₹1,00,000	33%	33%	≈ ₹5,000
₹1,50,000	50%	50%	≈ ₹7,500
₹2,40,000	80%	80%	≈ ₹12,000
₹3,00,000	100%	100%	₹15,000 (fully unlocked)

With only ₹1,00,000 achieved against a ₹3,00,000 target, the system unlocks roughly a third of the wallet (≈ ₹5,000) and will not allow further discounting until the counsellor reaches the next achievement threshold. This keeps discount power tied directly to revenue brought in.

Configurable Unlock Settings

- **Unlock model** — linear (unlock % equals achievement %, as above) or stepped/threshold (e.g., 25% / 50% / 75% / 100% bands unlock in chunks).
- **Unlock threshold / floor** — a minimum achievement before any wallet unlocks (e.g., nothing until 20% of target is hit).
- **"Close to threshold" tolerance** — allow unlock when achievement is within a set margin of a band (e.g., release the next band at 95% of it), so counsellors aren't blocked by a few rupees.
- **Per-client percentage cap** — independent of the wallet, no single client's discount may exceed the configured Max % per client (already present in your Wallet Top-ups screen).
- **No-full-burn rule** — the wallet can never be spent down faster than achievement unlocks it, preventing early exhaustion of the budget.

Why this works

It ties discount authority directly to results. A counsellor with a big target gets a big potential wallet — but must earn the right to spend it by actually hitting milestones. This focuses effort on the assigned target, rewards genuine achievement, prevents budget being burned early on weak leads, and naturally creates competition.

16.6 Strategic Wallet Allocation Engine

Beyond individual performance wallets, management needs a lever to steer the business toward specific countries, services or campaigns. The Strategic Wallet Allocation Engine lets the company issue ring-fenced bonus wallets that can only be spent on a defined segment.

- **Country / destination wallets** — e.g., a ₹2,000 Germany Bonus Wallet usable only on Germany leads and clients, to drive growth in that destination.
- **Campaign wallets** — e.g., an Italy Campaign Wallet to accelerate a slow market, with the same ring-fencing.
- **Service-line wallets** — push a specific service (e.g., a language course or a new exam) with dedicated budget.
- **Ring-fenced spend** — strategic wallet balance cannot be used outside its defined segment, so it always serves the intended business direction.
- **Stacking with personal wallet** — configurable whether strategic wallet is used before, after, or alongside the counsellor's earned wallet.

Why this is powerful

It hands management a direct steering wheel for business direction. When a destination or service needs growth, the company funds discounting there specifically — without inflating every counsellor's general wallet. Strategic intent, funded and ring-fenced.

16.7 Branch-Level Wallets & Competition

The same logic rolls up to branches. Each branch has a pooled budget and a leaderboard, creating competition both within a team and between branches.

- **Branch wallet** — a pooled monthly budget the branch manager can distribute among counsellors or hold in reserve for key deals.
- **Counsellor leaderboard** — live ranking by revenue, conversion and discount ROI, visible to the team.
- **Branch leaderboard** — branches ranked on the same balanced metrics.
- **Gamification** — badges, streaks and recognition for efficient, high-converting counsellors (not just high discounters).
- **Manager reserve** — a portion of branch budget held back by the manager for high-value or strategic deals.

16.8 Restricted Offer Builder — What Counsellors Can & Cannot Create

Counsellors should not be able to invent completely free-form offers, as that would expose margin to uncontrolled risk. Instead, the offer builder is restricted: counsellors pick from a set of pre-approved offer types they can run within their wallet, while higher-impact offers require approval. Anything beyond the approved set is requested, not created directly.

Allowed Without Approval	Requires Approval
Flat discount (within wallet & cap)	Custom scholarship
Percentage discount (within Max % per client)	Full fee waiver
Free SOP / document support	Premium service free of charge
Free consultation	Unlimited / open-ended discount
Free language assessment	Any offer exceeding wallet or % cap

Why restrict the builder

Open-ended offer creation is the single most dangerous area for margin. By letting counsellors self-serve only low-risk, pre-approved offer types — and routing scholarships, waivers and free premium services through approval — the company keeps discounting decentralised and fast without losing financial control.

16.9 Wallet Rules & Safeguards

Decentralising discount authority requires firm guardrails so the wallet cannot be abused or used to erode margin.

Rule	Purpose
Achievement-linked unlock	Spendable balance never exceeds the amount unlocked by target achievement

Rule	Purpose
Hard wallet cap	Total wallet can never be exceeded without approval
Per-client % cap	No single client's discount exceeds the configured Max % per client
Per-deal amount cap	Optional maximum discount amount on a single client/deal
Restricted offer builder	Only pre-approved offer types are self-serve; others need approval
Floor-price protection	No wallet spend can push a fee below the configured minimum
Carry-over / rollover policy	Configurable per wallet: expire or carry forward (matches Period Close)
Top-up approval	Manager can grant extra budget for a justified high-value deal
Audit log	Every wallet transaction is recorded — who, when, which client, how much
No self-referral / abuse	Wallet cannot fund offers to a counsellor's own linked accounts
Real-time balance	Counsellor always sees unlocked & remaining balance before applying an offer
Stacking respect	Wallet offers obey global stacking and total-discount limits

16.10 Mapping to the Existing Wallet Module

Future Link has already built the wallet infrastructure under the Incentives and Wallet menus (Give Discount, Wallet Top-ups, Period Close, My Incentives, Incentive Plans). In the current schema this is backed by the `discount\_wallets` table (budget kind, currency, rollover policy, per-client caps, validity, and scope tags), `incentive\_targets` / `incentive\_runs`, `wallet\_settings` (grace window), and the `fn\_close\_due\_wallets` function. This section maps the achievement-based logic onto those existing screens and tables so the new behaviour extends what is already live rather than replacing it.

Existing Screen / Table	Current Function	Enhancement Needed
Give Discount	Counsellor applies a discount against their `discount_wallets` balance	Show unlocked vs. potential balance; restrict to approved offer types; block spend beyond unlocked amount; funding-aware deduction
Wallet Top-ups	Create wallet, set budget kind, currency, Max % per client, rollover	Add target + Base Wallet + multiplier band; fund the scope-tagged (country/service) wallets; add unlock model
Period Close (`fn_close_due_wallets`)	Close due wallets, set rollover (expire/partial/full),	Compute Performance Score; record achievement %; feed both

Existing Screen / Table	Current Function	Enhancement Needed
	grace window via `wallet_settings`	into next period's wallet & multiplier
My Incentives / `incentive_targets`	Counsellor's targets and incentive view	Show achievement %, Performance Score, unlocked wallet, projection to next band
Incentive Plans / `incentive_runs`	Define incentive structures and payout runs	Hold Base Wallet, multiplier bands, score weights, unlock model, approved offer types
`discount_wallets` scope tags	`scope_country_tag`, `scope_service_code`, `scope_master_key` already present	Enforce ring-fenced spend = the Strategic Wallet Allocation Engine (16.6)

Integration point: connect Wallet ↔ Offers & Discounts

The wallet module and the Offers & Discounts module share one balance. When a counsellor applies an approved offer, the discount value is checked against — and deducted from — their unlocked `discount\_wallets` balance in real time, with the deduction amount determined by the offer's funding source. Both modules read and write the same wallet records, so reporting, caps and audit stay consistent across the two areas.

Good news: strategic wallets are half-built

The `discount\_wallets` table already carries scope tags (`scope\_country\_tag`, `scope\_service\_code`, `scope\_master\_key`) and a `scoped` budget kind. The Strategic Wallet Allocation Engine (16.6) is therefore mostly an enforcement-and-UI task on top of existing columns, not a new subsystem — a meaningful saving.

16.11 Wallet Dashboard (Counsellor View)

Each counsellor sees a simple personal wallet screen so they always know where they stand and how to unlock more.

- Assigned target, revenue achieved, and current achievement %.
- Performance Score and the multiplier band it earns.
- Potential wallet, amount unlocked so far, amount spent, and amount remaining.
- Wallet Impact Revenue and Wallet ROI vs. team average.
- How much more revenue is needed to unlock the next band, plus leaderboard position.
- Any strategic (country/campaign) wallet balance available to them, ring-fenced to its segment.

16.12 Benefits & Risks Summary

Benefits	Risks to Manage
Drives revenue and ownership	Could encourage over-discounting if ROI not tracked
Creates team & branch competition	Needs fair targets so it stays motivating
Rewards real system usage (Impact Revenue)	Requires clean attribution data
Quality Score blocks fake / poor sales	Needs reliable collections & feedback data
Strategic wallets steer business direction	Must be ring-fenced correctly
Restricted builder protects margin	Approval queue must be responsive

Recommendation

Yes — implement the performance-linked Offer Wallet, but score next month's allocation on discount ROI and conversion, not on volume of discount given. With ROI-based scoring, floor-price protection and a clear audit trail, the wallet becomes a powerful, self-funding way to grow revenue, sharpen counsellor focus, and create healthy competition across teams and branches — without putting margin at risk.

17. AI-Powered Offer Intelligence

Future Link already holds the two things AI needs to add real value here: rich CRM data on every lead and client (lifecycle stage, service interest, history, behaviour) and an offer-and-wallet engine that can act on a decision. This section specifies how AI can suggest offers on screen, draft messages, and — within strict guardrails — send offers automatically. It also sets out clearly what should be built sooner and what is better deferred until the offer and wallet data has matured.

Direct answer to the question

Yes — AI can suggest offers on screen and send some offers automatically. The recommended approach is two waves: build the on-screen suggestions and safe auto-sends relatively early (low risk, high value), and defer predictive scoring and fully autonomous sending until you have several months of your own redemption and conversion data to learn from. Crucially, AI always operates inside the existing wallet, per-client % cap and floor-price guardrails — it can suggest and draft freely, but can only auto-send within a counsellor's unlocked wallet balance.

17.1 What AI Does — Three Capabilities

Capability	What It Does	Where It Appears
Offer suggestion	Recommends the best-fit offer for a specific lead/client, with a reason	On the lead/client record and in Give Discount

Capability	What It Does	Where It Appears
Message drafting	Writes the WhatsApp / SMS / email copy for that offer, personalised	In the channel composer
Auto-send decision	Chooses whether, when and through which channel to send	Auto-offer engine (with approval phase first)

17.2 Who Can Use AI to Create Offers — Permissions

A clear principle separates creating offers from using them: AI-assisted offer creation is a central, controlled capability, while counsellors and branches choose from approved offers and may request custom ones. This keeps margin and brand control central while still giving the field flexibility.

Role	AI Offer Capability
Admin / Digital Marketing & Promotions team	Full AI offer creation — design new offers, generate variants, build campaigns, draft copy
Branch Manager	Choose and run approved offers for the branch; request custom offers from the centre
Counsellor	AI suggests which approved offer fits a lead, and drafts the message — cannot author new offer types

The principle: central creates, the field chooses

AI offer creation is limited to Admin or a designated owner — typically the Digital Marketing & Promotions team. Counsellors and branches pick from the approved offer catalogue or request a custom offer, which the centre builds for them (optionally with AI assistance). For counsellors, AI is strictly a suggestion-and-drafting assistant: it recommends the best approved offer for a lead and writes the message, but never invents a brand-new offer. This protects margin, keeps messaging on-brand, and still lets the field act fast.

17.3 On-Screen Offer Suggestions (Build Sooner)

When a counsellor opens a lead or client, the system displays a recommended offer (from the approved catalogue) alongside the reason it was chosen and a confidence indicator. The counsellor stays in control — they can accept, adjust within their limits, or dismiss it. This is high-value from day one and is largely a rules-plus-recommendation layer rather than heavy machine learning.

Example of what the counsellor sees:

Suggested offer for this lead

Recommended: 48-hour enrolment incentive (10% off, code auto-generated)

Why: Attended counselling 5 days ago, study-abroad interest, no payment yet, similar leads converted well with this offer.

Wallet check: Within your unlocked balance (₹12,000 available).

[Accept & send] [Adjust] [Dismiss]

The suggestion draws on the data already in the CRM:

- **Lifecycle stage** — new, engaged, demo attended, lapsed, existing client.
- **Service interest** — study abroad, exam coaching, language, visa/immigration.
- **Behaviour** — recency of contact, messages opened, forms started/abandoned.
- **History** — past offers received, what they responded to, spend to date.
- **Eligibility** — segment membership (Gen-Z, family group, cross-sell ready).
- **Wallet fit** — only suggests offers the counsellor can actually fund from unlocked balance.

17.4 Automatic Sending (Phased)

Auto-send should be introduced in graduated levels of autonomy so it earns trust and never risks margin. Each level can be enabled per trigger type and per branch.

Level	Behaviour	When to Enable
L0 — Suggest only	AI proposes; human sends everything	From launch
L1 — Auto-draft	AI writes the message; human clicks send	Early — saves counsellor time
L2 — Auto-send (safe triggers)	AI sends automatically for clearly-defined triggers (birthday, festival, abandoned form)	Once L1 is trusted
L3 — Auto-send (broad)	AI chooses offer, channel and timing across most triggers	After data matures + monitoring
L4 — Self-optimising	AI tunes offer depth and timing from outcomes	Mature stage only

Safe to auto-send early

Birthdays, enrolment anniversaries, festival campaigns and abandoned-application nudges are low-risk because the logic is unambiguous and the discount is pre-set. Start auto-send here. Hold higher-value or deeper-discount decisions at suggest/approve level until the AI has a track record.

17.5 Build Sooner vs. Defer

Build Sooner	Defer Until Data Matures
On-screen offer suggestions with reasons	Predictive conversion / propensity scoring
AI-drafted personalised messages	AI deciding the optimal discount depth
Auto-send for safe, defined triggers	Fully autonomous offer + channel + timing

Build Sooner	Defer Until Data Matures
Best-channel and best-time hints	Self-optimising offer experiments at scale
Wallet-aware suggestions	Churn / lapse prediction models

The reason for deferring the predictive pieces is simple: they need your own historical data to be reliable. The redemption, conversion and wallet data generated in the earlier phases is exactly what trains these models. Building the foundation first is therefore what makes the advanced AI accurate later.

17.6 Guardrails for AI

AI must operate strictly inside the controls already defined in this document. It can suggest and draft freely, but its ability to commit a discount is bounded.

- **Wallet-bounded** — AI can never auto-send a discount beyond the counsellor's unlocked wallet balance.
- **Creation-restricted** — only Admin / Digital Marketing may use AI to create new offers; counsellors get suggestions and drafts from the approved catalogue only.
- **Cap-respecting** — every AI suggestion obeys the per-client % cap, per-deal cap and floor-price protection.
- **Approval-aware** — anything above a counsellor's authority routes to the manager approval queue, even if AI proposed it.
- **Explainable** — every suggestion shows the reason and the data it used; no black-box discounts.
- **Auditable** — AI-initiated sends are logged identically to human ones (who/what/when/which client).
- **Human override** — counsellors and managers can always edit, pause or switch off AI per trigger or per branch.
- **Privacy-respecting** — AI uses CRM data only for offer relevance, in line with data-protection obligations.

Recommendation on timing

Cover the on-screen suggestions and safe auto-sends in this build (or the phase immediately after the wallet), because they save counsellor time and lift conversion with low risk. Treat predictive scoring and full autonomy as a later phase that is fed by the data the earlier phases generate. In short: design for AI now, switch on its judgement gradually.

18. Suggested Implementation Roadmap

A phased build delivers value early while leaving room for the advanced automation and analytics.

Phase	Scope	Outcome
Phase 1 — Foundation	Offer Library, Create Offer wizard, core offer types, coupon manager, roles & caps	Offers can be created, controlled and applied
Phase 2 — Channels	WhatsApp, SMS, email sending + templates, segments, approval workflow	Offers reach customers across channels
Phase 3 — Automation	Auto-offer rules engine, festival calendar, journeys, family & Gen-Z modules	Hands-free, behaviour-driven promotions
Phase 4 — Wallet & Competition	Counsellor & branch Offer Wallets, performance scoring, leaderboards, gamification	Decentralised, performance-linked discounting
Phase 5 — Intelligence	Full analytics, attribution, A/B testing, best-offer & best-time recommendations, social integration	Data-driven optimisation and ROI
Phase 6 — AI (assistive)	On-screen offer suggestions, AI-drafted messages, auto-send for safe triggers, wallet-aware recommendations	AI assists counsellors; conversion lift, low risk
Phase 7 — AI (autonomous)	Predictive scoring, optimal discount depth, autonomous offer/channel/timing, self-optimising experiments	Fully data-driven, self-tuning promotions

19. Summary & Recommendation

The recommended Offers & Discounts module is not a static discount list but a promotions engine: a central library of flexible offer types, dynamic CRM-driven targeting, a powerful auto-offer automation layer, omni-channel delivery, strict approval guardrails, and closed-loop analytics.

Prioritise the auto-offer engine and omni-channel delivery early, because that is where most lost leads are recovered and where counsellor effort is saved. Layer the family, Gen-Z, festival and existing-client offer types on top of that foundation. Once the core is stable, introduce the performance-linked Counsellor Offer Wallet to decentralise discounting, sharpen focus on assigned targets, and create competition between teams and branches. Design the system to be AI-ready from the start: switch on assistive AI (on-screen suggestions, drafted messages, safe auto-sends) early, and grow into predictive, autonomous AI as your own data matures — then let analytics drive continuous refinement.

Bottom line

Build it as create-once, target-precisely, deliver-everywhere, control-tightly, measure-always. That combination is what turns discounts from a cost into a controllable, measurable growth lever across all four of Future Link's service lines and all branches.

— End of Scope Document —
